

How To Make Layers Transparent?

1/24/2018

By default most of the layers are not transparent. If you display multiple layers one layer might hide the others. Additionally layers may hide the base map. You can adjust the transparency of the visible layers by moving the transparency slider. The transparency applies to all visible layers in that group.

1. Locate the [Layer List](#) in the [Left Panel](#).
2. Find the Transparency Slider next to the layer group you wish to change.
3. Slide the bar to the left to make the layers in that group transparent or to the right to make them less transparent.
